Institutional Governance Mandate

Sovereign Digital Asset Treasury and SLR Activation Engine

Together with the Strategic Framework for Multi-Volume Technical Litigation

Caustin Lee McLaughlin

Managing Trust Architect | Information Architect

November 2026

This instrument is the Volume I companion of the ten-volume bound set. It is drafted to serve simultaneously as an internal governance mandate, as a fiduciary record of professional judgment, and as a filing-ready reference for judicial clerks and administrative adjudicators. Substantive propositions are placed on one of four registers — adopted law, proposal, model/simulation, and design target — and assertions not yet supported by a record citation carry a **[CITE REQUIRED]** marker.

Part I

Institutional Governance Mandate: Sovereign Digital Asset Treasury and SLR Activation Engine

Chapter 1

Executive Mandate and Strategic Design Principles

1.1 Purpose, Custody, and Use Class of This Instrument

This Institutional Governance Mandate constitutes the definitive operational and legal blueprint for the Sovereign Digital Asset Treasury. It is architected not merely as a technical specification, but as a defensible record of professional judgment intended to withstand the scrutiny of judicial clerks, administrative adjudicators, and institutional fiduciaries. The Mandate merges high-stakes financial engineering with multi-jurisdictional legal doctrine to provide narrative coherence across the ten-volume bound set that comprises the full treasury architecture **[PROPOSAL]**.

All technical terminology employed herein is operationally defined in the Definitional Exhibit, which appears as Part III of this instrument. Terms are not used in their colloquial or industry-drift senses; where a coined term is used, the Definitional Exhibit governs.

Instrument control block

Instrument class	Governing mandate of a proposed institutional treasury and its liquidity-reserve protocol.
Governing law (proposed)	Swiss purpose trust, with the applicable law and situs questions reserved for the conflict-of-law analysis at §6.1.
Subject matter	Capital partitioning of a $500M portfolio; post-quantum custody; automated volatility defence; participant governance; node-network operations; quantified fiduciary risk management.
Bound-set position	Volume I companion instrument; supplies the Master Authority Matrix that governs Volumes II–X.
Register discipline	Four registers, applied at §1.3.
Prepared	November 2026.

1.2 The Five Pillars of Strategic Design

The integrity of the system is anchored by five pillars of strategic design. Each pillar is a design commitment of the proposed treasury; none is a statement of adopted law. For audit purposes the pillars are assigned the neutral codes **P1**–**P5** so that they cannot be confused with the authority-domain codes (CP, SG, DA, SR, LF) used to classify source authority elsewhere in the bound set. See Drafting Note D-1.

Code	Pillar	Commitment
P1	Capital Partitioning (CP)	The mathematical and physical segregation of the $500M portfolio into distinct risk-isolated pools, so that no single pool's failure can propagate across the treasury.
P2	Security and Cryptography (SG)	A multi-layer, post-quantum resilient framework utilising NIST-standardised primitives, adopted to satisfy "prudent-person" fiduciary duties rather than to satisfy a technical preference.
P3	Digital Assets and Data (DA)	The enforcement of computational reproducibility and a *claim-evidence-chain* for all ledger entries and participant quantifications.
P4	Sovereign Liquidity Reserve (SR)	Automated, algorithmic stability protocols designed to defend the treasury during high-volatility "flash-crash" events, operating as a tamper-resistant circuit breaker.
P5	Legal Framework (LF)	The anchoring of assets within a Swiss purpose trust, in order to navigate the doctrinal battlegrounds of cross-border insolvency and Article III limitations.

1.3 Register Discipline

A critical methodological commitment of this instrument, inherited from the bound set, is the explicit separation of four registers of statement. Every substantive proposition is assigned to exactly one register, and the assignment is displayed at the point of assertion.

Register	Meaning and examples drawn from this instrument
[ADOPTED LAW]	Binding statutes, regulations, published standards and reported decisions. Examples: NIST FIPS 203, 204 and 205; the Securities Exchange Act and SEC Rule 17Ad-17; *Harrington v. Purdue Pharma L.P.* (2024); *Mennonite Board of Missions v. Adams*; *Stern v. Marshall*.
[PROPOSAL]	Architectural, legislative or organisational designs that the author advocates but that no authority has adopted. Examples: the Sovereign Digital Asset Treasury itself; the SLR Activation Engine; the Swiss-situs purpose trust; the three-tier quadratic-voting governance model.

Register	Meaning and examples
[MODEL / SIMULATION]	Computational artefacts, reference implementations and numerical results produced by the author's own code. Examples: the capital-partitioning flow model at Volume II; the proof-of-reserve Merkle construction; the oracle-median aggregator simulation.
[DESIGN TARGET]	Engineering or operational goals not yet demonstrated at scale. Examples: the 32-node fault-tolerant network at 99.999% availability; the 3-geo-vault hardware custody configuration.

Where a factual assertion depends on a court docket, administrative record, or experimental measurement not yet placed in the reviewing record, the text carries a **[CITE REQUIRED]** marker. The consolidated schedule of such markers appears at Chapter 17.

1.4 Master Authority Matrix

The following matrix serves as the primary audit tool, mapping the Mandate's operational domains to the five pillars and to the volumes in which each domain is evidenced.

Drafting Note D-1 — Taxonomy collision between pillar codes and authority-domain codes

The source material uses the letter pairs CP, SG, DA, SR and LF in two inconsistent senses. In the Mandate's own matrix they expand to *Capital Partitioning, Security & Cryptography, Digital Assets & Data, Sovereign Liquidity Reserve, Legal Framework* (the Five Pillars). In the ten-volume framework they expand to *Constitutional/Procedural, Statutory/Governance, Data/Analytics, Scientific/Technical, Legal Framework* (authority domains). A clerk or auditor cannot determine from the bare code which taxonomy is in force at any given citation, and the defect is not clerical: it changes what a matrix mark asserts.
Resolution adopted in this instrument. The pillar codes are re-designated P1–P5 (§1.2). The authority-domain codes retain CP, SG, DA, SR and LF in their volume-level senses (§10.2). Table 1.3 therefore states the mandate's matrix in pillar notation, Table 1.4 states the volume-level authority regime, and Table 1.5 gives the crosswalk. No mark in any table is permitted to leave the code's taxonomy implicit.

Table 1.3: Pillar-oriented matrix (as given in the source, re-stated in P-codes).

Operational domain	P1	P2	P3	P4	P5	Primary volume
Capital architecture	•			•	•	II / VIII
Security framework		•	•			III
SLR activation engine	•			•		VI
Governance and voting			•		•	V
Compliance and legal					•	VIII

Table 1.4: Authority-domain matrix (volume-level source classification).

Code	Authority domain and its scope
CP	Constitutional / procedural. Notice standards (*Mennonite*); due process; Article III constraints (*Stern v. Marshall*).
SG	Statutory / governance. Bankruptcy Code; SEC rules; Swiss purpose-trust law; indenture-trustee fiduciary standards.
DA	Data / analytics. Financial models for the $500M partition; fee tables; statistical analysis plans.
SR	Scientific / technical. Cryptographic specifications (NIST ML-DSA, ML-KEM, SLH-DSA); node hardware; SLR activation logic.
LF	Legal framework. *Purdue Pharma* precedent; conflict-of-law analysis; case law on prudent-person duties.

Table 1.5: Crosswalk: pillar commitment to authority domain principally engaged.

Pillar	Commitment	Authority domain principally engaged
P1	Capital partitioning	DA (modelling), SG (restructuring authority), LF (asset-protection doctrine)
P2	Security and cryptography	SR (standards), SG (fiduciary duty of care), CP (procedural integrity of records)
P3	Digital assets and data	DA (reproducibility), CP (notice and ascertainability), SR (ledger construction)
P4	Sovereign liquidity reserve	SR (protocol), DA (trigger statistics), SG (authority to deploy)
P5	Legal framework	LF (governing law), CP (Article III limits), SG (trust and insolvency statutes)

1.5 Authority Identifier Convention

The ten-volume framework requires that every dollar amount or technical specification carry a specific Authority Identifier linked to the Master Authority Matrix. This instrument instantiates the convention as follows.

Authority Identifier format

`AUTH-<DOMAIN>-<VOLUME>-<NNN>`

Examples: `AUTH-DA-II-004` for the $500M to $300M partition model; `AUTH-SR-III-011` for the ML-DSA parameter selection; `AUTH-LF-VIII-002` for the Swiss-situs governing-law election. The reserved identifier block for the figures stated in this instrument appears at Chapter 18.

1.6 The "So What?": Impact on Participant Integrity

Traditional custodial frameworks suffer from what the source materials characterise as a 40% unaccommodated error rate regarding beneficial-holder identification **[CITE REQUIRED]** `AUTH-DA-VIII-000`. For the participants involved — stated in the source materials as 1.15 million American holders **[CITE REQUIRED]** `AUTH-DA-VIII-001` — this treasury replaces "nominee status" with a rigorous claim-evidence-chain. By tracing every participant interest directly to the evidentiary records, the treasury is designed to transform invisible beneficial holders into "reasonably ascertainable" parties, thereby addressing the constitutional floor for due process articulated in *Mullane* and *Mennonite* **[ADOPTED LAW]**.

Note the register shift within a single sentence: the 40% figure and the 1.15 million-holder figure are *model outputs*, not judicial findings. They must be presented as such, and both must trace to a methodology disclosure before they are used in any filing. See Drafting Note D-9.

Chapter 2

Capital Architecture and Custodial Segregation

2.1 Purpose of the Partition

To mitigate systemic risk in a $500M institutional portfolio, the treasury shall implement a rigid capital-partitioning strategy. This architecture prevents single-point-of-failure contagion by isolating assets according to liquidity profile and legal encumbrance. The partition is a design commitment of the proposed treasury **[PROPOSAL]** and rests on modelled cash-flow behaviour **[MODEL / SIMULATION]** `AUTH-DA-II-004`.

2.2 The $500M to $300M Partition Logic

The partition defines the following operational paths.

Path	Description
DTC delivery path	Integrates traditional security record-holding frameworks with digital delivery, specifically addressing the book-entry securities gap (§2.3).
Lombard path	Assets utilised for credit-backed financing, held as collateral against a facility rather than sold.
Liquidation path	Assets earmarked for immediate market-buy operations, and therefore required to be liquid within the deployment window.
Vault A ($300M)	High-security, long-term holdings in the Deep Cold configuration `AUTH-SR-VIII-021`.
Vault B ($200M)	Active operational liquidity and reserve assets serving the SLR Activation Engine.

Drafting Note D-5 — Unreconciled "3.5B" figure in the Vault A/B split

The source framework states that "the $500M to 300M partition and the 3.5B Vault A/B split" must both trace to the Financial Model in Volume VIII. The Vault A/B split is elsewhere stated as $300M ($Vault A) against $200M ($Vault B), which sums to the $500M principal. A "3.5B" figure is therefore inconsistent with every other statement of the partition and appears to be typographical.

Action required before filing. Either (i) the figure is struck and the split is stated as $300M/$200M throughout, or (ii) if a 3.5-billion figure is intended, the instrument under which it arises must be identified and a second Financial Model exhibit added, because a tenfold discrepancy in the capital base defeats the traceability requirement on its own terms.

2.3 The Book-Entry Securities Gap

The DTC delivery path is directed at a structural gap: traditional record-holding places a nominee between the issuer and the beneficial owner, so that the party holding legal title and the party bearing the economic interest are not the same. The consequence relied upon in this framework is that corporate and judicial actions conducted at the record-holder level may never reach the beneficial holder, who is nonetheless the party whose property is affected **[PROPOSAL]**.

The framework's central assertion — that the "reasonably ascertainable" standard must encompass beneficial holders discoverable through regulatory filings and participant lists — is advanced as a proposed extension of settled doctrine, not as settled doctrine itself, and is so pleaded at §11.2.

2.4 Lombard and Liquidation Bifurcation

The bifurcation between credit-backed (Lombard) and immediately realisable (liquidation) paths is the mechanism by which the partition is made to survive stress. Assets committed to a Lombard facility are not simultaneously available to the SLR Activation Engine; the reverse is equally true. This exclusivity is what gives the partition its meaning, and any operational instruction that re-hypothecates an asset across both paths defeats Pillar P1 without any visible change to the ledger.

Chapter 3

Multi-Layer Post-Quantum Security Framework

3.1 The Five Defence Layers

Transitioning to post-quantum resilience is treated in this instrument as a core fiduciary requirement rather than an engineering preference. The framework employs a defence-in-depth strategy across five layers.

Layer	Control
Physical	Assets distributed across three geo-vaults using hardware security modules with FIPS 140-3 Level 4 tamper-resistance `AUTH-SR-III-002`.
Cryptographic	ML-DSA-65, ML-KEM-768 and SLH-DSA, being the NIST FIPS 203/204/205 selections. Non-lattice-based alternatives were rejected as currently lacking the standardised prudent-person defence required for institutional litigation.
Network	Hardened topology: DDoS mitigation, then web application firewall, then load balancer.
Application	Secure software development life cycle requiring multi-signature code attestation.
Operational	Role-based access control matrix enforced through cryptographic hardware tokens.

Drafting Note D-2 — Parameter-set conflict between the Mandate and the trust architecture

This Mandate specifies ML-DSA-65 and ML-KEM-768. The integrated trust architecture described elsewhere in the bound set specifies ML-DSA-87 and ML-KEM-1024, and the ADR exchange implementation specifies the same higher parameter set. These are different security categories under the same standards, not different standards, so the discrepancy will not be visible to a reader who checks only the standard numbers.

Three acceptable resolutions, in order of preference.

1. State a per-layer parameter policy — for example, signing authority over the trust corpus at category 5 (ML-DSA-87), routine operational signing at category 3 (ML-DSA-65) — and record the policy as a table, so that every key in the system has exactly one declared parameter set.
2. Unify on the higher set throughout and strike the lower set from this chapter.
3. Retain both but add an express justification for each divergence, which is the least defensible of the three because the justification will itself require a threat model not yet in the record.

Whichever is chosen, the cryptographic integrity markers at §19.2 must record the parameter set per key, since a single mismatch between a declared policy and an operational key is a testable defect that an adverse expert can demonstrate cheaply.

3.2 Alternatives Rejected

Selected	Rejected alternative	Reason recorded
ML-DSA-65 (FIPS 204)	RSA / ECDSA	Classical signatures are exposed to future decryption and forgery risk in a quantum-adversary model; retaining them after a standard exists is difficult to defend as prudent.
ML-KEM-768 (FIPS 203)	Classical key exchange	Same exposure; also forecloses harvest-now-decrypt-later attacks on recorded ciphertext.
SLH-DSA (FIPS 205)	Lattice-based signatures alone	A hash-based root of trust reduces reliance on a single algebraic hardness assumption for the longest-lived keys.

3.3 The "So What?": Legal Defensibility

The multi-layer approach is intended to establish a prudent-person defence. By adhering to the NIST post-quantum standards, the treasury is positioned to demonstrate a standard of care exceeding current market practice at the date of adoption, which is the showing a fiduciary needs in order to resist a claim of technical negligence or foreseeable loss during the transition to quantum-ready environments **[PROPOSAL]**.

Two qualifications should be recorded against that position. First, "exceeds current market practice" is a comparison that decays; it must be re-evidenced periodically or it becomes an assertion about a past date. Second, adherence to a standard is a floor, not a defence by itself: an adversary will ask what the treasury did about implementation, key custody and rotation, which is why the cryptographic integrity markers at §19.2 and the reproducibility register at Chapter 19 are load-bearing rather than decorative.

Chapter 4

The Sovereign Liquidity Reserve Activation Engine

4.1 Function and Character

The SLR Activation Engine is an automated financial mechanism designed to maintain treasury stability during extreme market volatility. It is intended to function as a tamper-resistant circuit breaker that operates with algorithmic certainty **[PROPOSAL]** `AUTH-SR-VI-003`.

4.2 Deployment Protocol

The engine uses a four-oracle median aggregator to ingest real-time price data. Activation occurs only when four flash-crash trigger conditions are met *simultaneously*:

1. Liquidity depth in the affected pair falls below the declared floor;
2. Velocity of price decay exceeds the declared threshold;
3. Spread divergence between venues exceeds the declared band;
4. Volume anomaly exceeds the declared multiple of the rolling baseline.

Upon trigger, the engine executes four steps in sequence:

1. **Buy-wall establishment.** Placement of automated limit orders at calculated support levels.
2. **Market-buy execution.** Strategic absorption of selling pressure using the Vault B reserve.
3. **Reserve split.** Post-trade re-balancing of liquidity to preserve continued operational capacity.
4. **Post-activation reconciliation.** Immediate audit and cryptographic logging of the event `AUTH-SR-VI-004`.

4.3 Design Rationale: Oracle Risk Mitigation

The four-oracle median protocol is specifically directed at oracle-manipulation risk. By taking the median rather than the mean, the system ensures that any single compromised or outlier data feed — whether from technical failure or a malicious actor — cannot trigger an unauthorised reserve deployment **[MODEL / SIMULATION]**. This preserves institutional assets against flash-loan style manipulation of the kind prevalent in decentralised environments.

Two limitations belong in the record alongside the rationale. The median resists a single outlier; it does not resist a coordinated majority, so the number of independent oracle operators, and their independence, is the real security parameter. And a trigger that requires four simultaneous conditions is resistant to noise but slow to fire; the record should therefore state the maximum price decay the treasury accepts while the fourth condition is still travelling, which is a calibration question rather than a cryptographic one.

4.4 Concurrency and Re-entrancy

Because the engine both reads market state and writes orders into the same market, the specification prohibits a second activation while an activation is open, and requires that reserve-split accounting complete before the engine returns to the armed state. This is recorded here as a design constraint because an engine that can re-enter its own deployment sequence turns a circuit breaker into an amplifier.

Chapter 5

Institutional Governance and Quadratic Voting

5.1 Three-Tier Governance Model

The treasury employs a three-tier governance model intended to eliminate centralised points of failure while preserving operational agility **[PROPOSAL]** `AUTH-DA-V-007`.

Tier	Scope
Immutable / constitutional	Fundamental logic and participant rights, not amendable by ordinary vote.
Operational	Parameters governing node selection and SLR thresholds.
Tactical	Day-to-day administrative adjustments.

The tiers are ordered, so that an operational vote cannot alter a constitutional term and a tactical adjustment cannot alter either. A governance defect arises whenever the tier at which a decision was taken is not recorded with the decision; the Authority Identifier Index at Chapter 18 therefore requires the tier to be recorded as a field.

5.2 Quadratic Voting Mechanics

The treasury employs the cost function

$$\text{Cost} = (\text{Votes})^2.$$

For non-technical legal reviewers, this means that while a participant may cast multiple votes, the credit required for each additional vote increases exponentially: one vote costs one credit, two cost four, three cost nine.

5.3 Design Rationale: Addressing the Record-Holder Gap

Quadratic voting is deployed to protect minority beneficial holders. Where holders are masked behind a nominee, they are invisible in corporate actions. The delegation mechanic allows those holders to surface their property-like interests. The structure therefore addresses the record-holder gap by giving those with the highest investment-backed expectations a weighted voice that cannot be easily drowned out by centralised aggregators **[PROPOSAL]**.

The rationale should be stated with its own counter-argument: quadratic voting weights *intensity* of preference, not the *quantum* of property at risk, so a large beneficial holder may be outvoted by a numerous group with small holdings. Whether that is a feature or a defect depends on the instrument's stated purpose, and the purpose should be stated in the constitutional tier rather than left to be inferred from the mechanism.

Chapter 6

Swiss Trust Legal Framework and Global Compliance

6.1 Governing-Law Selection and Its Consequences

The selection of a Swiss purpose trust as the governing arrangement is intended to provide a cross-border asset-protection mechanism resilient to domestic insolvency stay orders [PROPOSAL].

Drafting Note D-7 — Trust situs, asset situs, and the recognition question

A governing-law election and an asset location are distinct facts, and courts treat them differently. The instrument should state, separately: (i) the law governing the trust; (ii) the situs of the trustees; (iii) the situs of the custodians holding the securities; and (iv) the courts whose orders the structure is designed to resist. An election of foreign law does not, without more, determine whether a domestic court will give effect to it over assets located domestically, nor whether a stay entered against a participant-with-a-nexus will be treated as ineffective.

Additional point for reconciliation. The PSDLEF work elsewhere in the bound set proceeds on a perpetual purpose trust of United States formation, whereas this Mandate proceeds on a Swiss-situs purpose trust. If both are intended, the relationship between them must be stated expressly — which entity holds which assets, and by what instrument — because a reader who encounters both without a stated relationship will infer that the drafter had not noticed.

6.2 Multi-Jurisdiction Compliance Matrix

Drafting Note D-6 — Correction of the Singapore regulator citation

The source matrix cites "Digital Asset Services Act (DASA)" as the Singapore instrument administered by MAS. There is no statute of that name in Singapore. The operative regime is the **Payment Services Act 2019**, in force from 28 January 2020, which regulates digital payment token services and imposes licensing, anti-money-laundering, technology-risk and customer-asset-protection obligations on providers; superimposed on it is the MAS **Single-Currency Stablecoin** framework announced in August 2023, which imposes reserve, capital,

redemption and disclosure requirements on qualifying stablecoin issuers above the S$5 million circulation threshold. On 1 September 2026 MAS opened a public consultation on amendments to the Payment Services Act that would introduce a distinct *stablecoin issuer licence* as a new licence class under the Act.

Correction to be applied before filing. Replace "Digital Asset Services Act (DASA)" with "Payment Services Act 2019 (digital payment token services); MAS Single-Currency Stablecoin framework (2023); Payment Services Act amendment consultation (1 September 2026, pending)". The amendment consultation is a *proposal* and must be registered as such; the Act and the 2023 framework are adopted law.

Jurisdiction	Regulatory body	Core compliance focus
CH (Switzerland)	FINMA	Purpose-trust doctrine; fiduciary custody.
US (United States)	SEC; USITC	Form 13(f) reporting; the *Purdue Pharma* analysis; SEC Rule 17Ad-17 search and escheatment compliance.
SG (Singapore)	MAS	Payment Services Act 2019 digital payment token services; Single-Currency Stablecoin framework.
IE (Ireland)	CBI	EU gateway and passporting rights.

6.3 The "So What?": *Harrington v. Purdue Pharma* and the Article III Question

Drafting Note D-3 — Two distinct doctrines are being blended

The source passage attributes the *Purdue Pharma* problem to an "Article III pitfall." These are two different limits and should be pleaded separately, because a court can accept one and reject the other.

(a) Release authority. In *Harrington v. Purdue Pharma L.P.*, decided 27 June 2024 by a 5–4 Court, the Supreme Court held that the Bankruptcy Code does not authorise a chapter 11 plan to release claims against non-debtors held by third parties without those third parties' consent, preserving the pre-existing treatment of asbestos-related liabilities. This is a question of *statutory authorisation* under the Code, not of Article III.

(b) Adjudicatory authority. *Stern v. Marshall* concerns the constitutional limits on a non-Article III tribunal's power to decide a claim, and turns on whether the matter is a public right or a private right between private parties. That is where the Article III argument lives.

Consequence for drafting. The 2024 decision is the correct authority for the proposition that non-consensual third-party releases are not available; *Stern* is the correct authority for the proposition that a bankruptcy court cannot finally adjudicate certain private-law claims between non-debtors. Asserting the first as if it were the second invites a footnote correction that costs credibility on the propositions that actually matter. Citations to be pinned to the official reporter before filing.

The 2024 ruling established that chapter 11 plans cannot utilise non-consensual third-party releases to discharge claims against non-debtors **[ADOPTED LAW]**. The Swiss structure is intended to avoid the corresponding domestic difficulty by treating indenture covenants as "bundles of sticks" property interests rather than mere executory contracts **[PROPOSAL]** `AUTH-LF-VIII-002`. Unlike United States bankruptcy courts, which are constrained by *Stern v. Marshall* from adjudicating private-law claims between non-debtors, the Swiss trust is intended to preserve those private rights as fiduciary-encumbered property, resisting the summary extinguishment characteristic of domestic restructuring.

Chapter 7

Global Node Network and Operational Playbook

7.1 Jurisdictional Decentralisation

Jurisdictional decentralisation is treated as mandatory in order to ensure node resilience against localised regulatory or technical failure [**DESIGN TARGET**] `AUTH-SR-VII-008`.

Hub	Nodes	Minimum hardware specification
Zurich	8	64 GB RAM, dedicated HSM, 2 TB SSD, 10 Gbps.
Singapore	8	64 GB RAM, dedicated HSM, 2 TB SSD, 10 Gbps.
London	4	32 GB RAM, shared HSM, 1 TB SSD, 5 Gbps.
New York City	4	32 GB RAM, shared HSM, 1 TB SSD, 5 Gbps.
Edge cities	8	16 GB RAM, software HSM, 500 GB SSD, 1 Gbps.
Total	**32**	—

Drafting Note D-4 — "Ten jurisdictions" is not evidenced by the node table

The framework asserts a network of 32 nodes across 10 jurisdictions. The table accounts for 32 nodes across five named hubs (Zurich, Singapore, London, New York City, and an undifferentiated "edge cities" group). The remaining jurisdictions are not named anywhere in the source material.

Two ways to cure, either is sufficient. Either (i) enumerate the five unnamed jurisdictions and their node counts, so that the table sums to 10 jurisdictions as asserted; or (ii) restate the claim as "32 nodes across five principal hubs, registered in ten jurisdictions," and support only the part that the hardware schedule actually evidences. As drafted, the claim of ten jurisdictions is unsupported by the instrument's own table, which is the kind of arithmetic a reviewing clerk performs in under a minute. Threshold "99.999% uptime" is likewise a design target and must be presented as such until operating history exists.

7.2 Daily Checkpoints and Severity Escalation

Operations follow four daily checkpoints at 00:00, 06:00, 12:00 and 18:00 UTC. Any deviation triggers a four-tier severity escalation matrix, moving from automated remediation to prudent-person intervention by the Chief Digital Asset Architect **[PROPOSAL]**.

The record should state, for each tier, the objective condition that promotes or demotes the incident, the person or role competent to act at that tier, and the maximum time permitted at that tier before automatic promotion. A severity ladder without time limits is a description of an intention rather than a control.

Chapter 8

Quantitative Risk Management and Fiduciary Safeguards

8.1 Risk Matrix

To provide a defensible record of prudent-person judgment, the treasury quantifies its principal risks and the mitigation adopted against each.

Risk	Likelihood	Impact	Mitigation
Oracle manipulation	Low	High	Four-oracle median aggregation (§4.3).
Beneficial-holder invisibility	High	High	*Mullane–Mennonite* notice framework, using SEC Form 13(f) discoverability to identify participants.
Post-quantum vulnerability	Low	Critical	NIST FIPS 203/204/205 implementation (§3.1).

The likelihood entries are judgements, and the instrument should record who made them and on what evidence, or relabel the column as a stated design assumption. A quantified risk matrix whose likelihood column has no provenance is more exposed than one that openly says "assumed."

8.2 The "So What?": Equitable Tolling

The treasury must navigate the circuit split on equitable tolling. While the Eleventh Circuit has maintained textual rigidity regarding bar dates, a line of authority emphasises that bankruptcy and trust courts are courts of equity. By implementing a proactive notice and audit system, the treasury prepares for an equitable-principles construction, so that the error rate in traditional ledgers does not result in a taking of participant property without due process **[ADOPTED LAW]** (for the underlying due-process and equitable principles) **[PROPOSAL]** (for the application to this structure).

The specific authorities relied on for the circuit split and for the equity characterisation are to be pinned with reporter citations at Chapter 17 before any filing.

8.3 SEC Rule 17Ad-17 and Escheatment

SEC Rule 17Ad-17, adopted under the Securities Exchange Act, sets minimum search requirements for transfer agents seeking lost securityholders, requiring at least two database searches using the holder's social security number or name, precisely because the alternative may be escheatment of the holder's property to a state **[ADOPTED LAW]**. The Commission has proposed amendments that would expand these outreach requirements beyond lost holders to *inactive* securityholders **[PROPOSAL]** (pending as at November 2026).

The distinction matters for this framework. A passive compliance posture satisfies the rule; the framework's object is the stronger position, in which a holder who cannot be found by ordinary search is nonetheless rendered ascertainable because the treasury holds a claim-evidence-chain. Rule 17Ad-17 is therefore cited here as a regulatory floor and as evidence that the problem the framework addresses is one the Commission itself recognises, not as the source of the treasury's obligation.

Chapter 9

Technical Appendix: Protocol Specifications

9.1 Core Stack and Freeze Discipline

Component	Specification
Bitcoin Core	v28.0 as stated in the source materials.
Lightning Network	v0.18-beta as stated in the source materials.

Drafting Note D-8 — Tag pinning does not satisfy the instrument's own reproducibility rule

The Mandate requires that all software builds be referenced by version-control hashes (SHA-256) and dependency manifests. A release tag such as "v28.0" identifies a mutable pointer in principle and, more practically, does not identify the build actually deployed. Before filing, each component should carry: the annotated tag, the commit hash of the tag, the commit hash of the deployed build, and the dependency manifest digest. Version currency at the filing date should also be confirmed, since a superseded release is a fact an adverse expert will raise.

9.2 Proof Systems

System	Specification
PoR (proof of reserve)	Merkle-tree based cryptographic attestation of $500M in assets [MODEL / SIMULATION] `AUTH-SR-VIII-031`.
PoL (proof of liability)	Pedersen commitment specification `AUTH-SR-VIII-032`.

9.3 Data Integrity, APIs and Schemas

All software builds are to be referenced by version-control hashes (SHA-256) and dependency manifests. Full REST and WebSocket API endpoint lists and SQL database schemas are operationally defined in the Technical Exhibit at Volume VIII, Exhibit 11.2 `AUTH-SR-VIII-040`.

9.4 Traceability

All protocols defined herein are directly traceable to the Master Authority Matrix, so that every technical action serves a specific, documented fiduciary mandate. Chapter 18 records the identifier assignments; Chapter 19 records the reproducibility register.

Part II

Strategic Framework for Multi-Volume Technical Litigation

Chapter 10

Architectural Foundations: The Ten-Volume Portfolio Structure

10.1 Why a Bound Set Rather Than Consolidated Filings

Managing a litigation portfolio in which constitutional lacunae intersect with post-quantum cryptographic standards requires a transition from consolidated filings to a meticulously structured ten-volume bound set. The architectural shift is a strategic imperative: it isolates cross-disciplinary complexity into discrete domains, so that the claim-evidence-chain remains auditable for judicial clerks and regulatory adjudicators, and so that the complexity collapse characteristic of high-stakes technical disputes is prevented **[PROPOSAL]**.

The Information Architect is responsible for maintaining this structural discipline without exception.

10.2 Volume Allocation

Vol.	Primary function	Core content focus
I	Executive overview	Mission statement; the Five Pillar design principles; Master Authority Matrix summary; this Mandate.
II	Capital structure	Bond portfolio flow ($500M to $300M partition); Vault A/B split; Lombard against liquidation paths.
III	Multi-layer security	NIST FIPS 203/204/205 implementation; physical geo-vaults; SSDLC pipeline; RBAC matrix.
IV	Exchange and definitions	L3 order book; matching logic; fee structure; defined terms (for example “Phantom variant OCR”).
V	Governance module	Three-tier governance; quadratic voting cost function; immutable constitutional mechanics.
VI	Administrative record	Chronological agency interactions (SSA, USITC); procedural event tracker; exhaustion evidence.

Vol.	Primary function	Core content focus
VII	Node network	32 nodes across the declared jurisdictions; hardware and tier specifications.
VIII	Technical and academic	Financial models; reproducibility statements; PoR and PoL specifications; settlement stack; API schema.
IX	Legal framework	Swiss purpose-trust law; indenture-trustee prudent-person duties; SEC Rule 17Ad-17; escheatment.
X	Operations and risk	Continuous operations; four-tier severity escalation; quantified risk and impact scores; mitigations.

10.3 Scope and Authority Matrix

Each volume commences with a Scope and Authority Matrix. The index cross-references every proposition against the five authority domains and every figure against an Authority Identifier linked to it. Authority-domain codes appear at Table 1.4; the identifier format appears at §1.6.

Drafting Note D-10 — The identifier requirement is stated but not instantiated

The framework mandates that every dollar amount and technical specification carry an Authority Identifier, yet the source materials attach only volume-and-exhibit references ("Vol. VIII, Ex. 4.2") and never an identifier. An auditor cannot verify a convention that has no instances. The reserved identifier block at Chapter 18 is supplied so that the convention acquires instances from this instrument forward.

Chapter 11

Scaffolding Novel Legal Theories and Jurisprudential Framing

11.1 The Five-Step Instructional Protocol

Novel theories are high-stakes interventions and must be explicitly scaffolded in order to maintain judicial trust. Where a theory advances through a doctrinal gap, the following protocol is mandatory.

1. **State existing doctrine.** Define the settled law as the foundational floor.
2. **Identify the gap or ambiguity.** Name specifically the modern complexity the law does not address.
3. **Present the theory as an extension.** Frame it as a logical application, using the phrase "it is respectfully submitted that."
4. **Reason by analogy.** Support the extension with established precedent.
5. **Discuss strengths and weaknesses candidly.** Identify counterarguments, in order to build transparency and clerk-level trust.

11.2 Application: The Constitutional Lacuna in Book-Entry Securities

The portfolio must address the gap between record-holder frameworks and constitutional notice. *Mennonite* requires notice to a party whose name is reasonably ascertainable, yet beneficial holders are often masked behind a nominee **[ADOPTED LAW]**.

Strategic assertion, pleaded at the correct register

It is respectfully submitted that the "reasonably ascertainable" standard must encompass beneficial holders discoverable through SEC Section 13(f) filings and participant lists; and that the failure to reconcile regulatory data with the notice apparatus constitutes a remediable constitutional defect **[PROPOSAL]**.

11.3 *Harrington v. Purdue Pharma* Compliance Checklist

Every proposed release is filtered through the following audit checklist.

	Question	**Why it is asked**
☐	Consent type	Is there affirmative agreement, or is it "deemed consent" by silence? Silence was held insufficient.
☐	Claim classification	Is the claim direct (owned by the creditor) or derivative (owned by the estate)? Only the latter is within the estate's power to release.
☐	Cross-border route	Does the release depend on a chapter 15 recognition, where foreign recognition may be sought for what domestic chapter 11 could not authorise?
☐	Adjudication forum	Does the release rest on state-law claims between private parties lacking a public-right nexus, engaging *Stern v. Marshall*?

High-level framing is anchored to the claim-evidence-chain so that it withstands a motion to strike.

Chapter 12

Technical Integrity: The Claim-Evidence-Chain

12.1 Handling Unsupported Quantifications

Generic figures are prohibited. Every quantification — in particular the $500M to $300M partition and the Vault A/B split — must trace directly to the Financial Model at Volume VIII.

- **Methodology disclosure.** The drafter must disclose all limitations of the underlying study. A narrower, defensible claim is strategically superior to a sweeping assertion that invites a challenge to the advocate's integrity.
- **Audit trail.** Figures must carry a parenthetical reference to the specific page and line of the methodology disclosure in Volume VIII.
- **Register label.** Modelled figures are labelled **[MODEL / SIMULATION]** and are not permitted to appear in the same grammatical position as adopted law or as a court finding.

12.2 Definitional Exhibit Protocol for Coined Terminology

For terms such as "Phantom variant OCR pipeline" or "SLR Activation Engine," the following four elements must be supplied in a Definitional Exhibit:

1. **Operational definition** — the precise practice-based function.
2. **Distinction** — explicit contrast with existing industry terminology.
3. **Evidentiary basis** — for software terms, version-control hashes or dependency manifests proving the system's existence and state.
4. **Justification** — why existing terms are inadequate to the technical reality.

Part III applies this protocol to the coined terms used in this instrument.

Chapter 13

Cross-Domain Integration: Patent Prosecution and Administrative Records

13.1 Volume VI: Administrative Record and Exhaustion

The administrative record is the first point of judicial review. It must include:

- A **dual-index system**, categorising entries by date and by subject matter.
- An **agency interaction chronology** as a standalone section for each agency involved.
- A **procedural event tracker**, logging every submission, response and exhaustion milestone.

13.2 Indenture Trustee Duties and Patent Relevance

The legal volume asserts the post-default duties of indenture trustees, emphasising that those duties are not extinguished by a discharge where unmapped equity distributions remain **[PROPOSAL]**.

Each patent specification includes a litigation-relevance statement explaining how the invention relates to the broader factual theory, accomplished without importing litigation argument into the claims themselves, so that prosecution remains clean.

Chapter 14

Academic Rigor and Scientific Reproducibility Protocols

14.1 Mandatory Scientific Components

Volume VIII is the cornerstone for admissibility under judicial review, transforming technical specifications into a record of professional judgment. All computational methods must include:

1. A **reproducibility statement**, with clear paths for third-party verification.
2. A **statistical analysis plan**, stating the mathematical framework for every quantification.
3. **Integrity markers**, mandatorily including NIST FIPS 203 (ML-KEM), 204 (ML-DSA) and 205 (SLH-DSA).

14.2 The "Alternatives Rejected" Mandate

Each architectural choice must include a design rationale that does not merely state the choice, but explains:

- **Why the alternatives were rejected** — for example, "RSA was rejected in favour of the NIST post-quantum algorithms to mitigate future decryption risk."
- **Fiduciary alignment** — how the choice meets the prudent-person standard for trust administration.
- **Regulatory-gap mitigation** — how the design addresses SEC Rule 17Ad-17 and state escheatment obligations for lost securityholders.

14.3 Conclusion of the Framework

The Master Authority Matrix is the ultimate instrument of this filing strategy, ensuring that the ten-volume portfolio is auditable, defensible and structurally resistant to challenge. Its authority

depends, however, on the matrix having instances: an identifier for every figure, a register for every proposition, and a pin cite for every authority. The registers at Part IV exist to discharge that dependency.

Part III

Definitional Exhibit: Coined Terminology

Chapter 15

Definitional Exhibit

Each entry below follows the four-element protocol of §12.2: operational definition, distinction, evidentiary basis, and justification. Where the evidentiary basis requires a version-control hash or dependency manifest that has not yet been produced, the field is left as a blank to be completed rather than as an assertion.

15.1 Term 1.1 — Phantom Variant OCR Pipeline

Element	Content
Operational definition	An optical character recognition pipeline that, for each input image, generates and reports the competing recognised variants together with a confidence measure, and records the rejected variants within the same audit record, rather than committing to a single best-string output.
Distinction	Conventional OCR returns one string per region and discards the alternatives; the evidentiary consequence is that the discarded readings are unrecoverable and the recognised string cannot be audited against the image. The "phantom variant" construction preserves the alternatives precisely so that a later reviewer can test the reading.
Evidentiary basis	To be supplied: repository identifier, commit hash of the released build, dependency manifest digest, and a worked example holding input image, all candidate variants, and the resulting record entry.
Justification	Existing terminology ("OCR," "confidence scoring," "ensemble OCR") does not convey the retained-variant and audit property, which is the property the framework actually relies upon.

15.2 Term 1.2 — SLR Activation Engine

Element	Content
Operational definition	A conditional, state-machine-governed mechanism that monitors declared market-stress conditions and, on the simultaneous satisfaction of all declared trigger conditions, executes a fixed four-step reserve-deployment sequence against a segregated reserve pool.
Distinction	A trading algorithm optimises an objective; a circuit breaker halts activity; this engine does neither. It deploys a pre-committed reserve in a fixed sequence.
Evidentiary basis	To be supplied: trigger-condition parameters; the deployment state machine; the reconciliation record schema; a scenario run showing that no single-feature condition suffices to trigger.
Justification	"Market maker," "circuit breaker" and "stabilisation fund" each describe a different mechanism; none describes a pre-committed conditional deployment with a reconciliation duty.

15.3 Term 1.3 — Claim-Evidence-Chain

Element	Content
Operational definition	A requirement that every asserted proposition, and every figure, be linked by an explicit record reference to the primary evidence that supports it and to the instrument that authorises the proposition, with the link auditable in both directions.
Distinction	A citation shows that a source was read; a claim-evidence-chain additionally shows what the claim deduces from the source, at what register, and with what limitation disclosed.
Evidentiary basis	The registers at Chapters 16–19 of this instrument, together with the identifier block at Chapter 18.
Justification	"Supporting evidence" and "citation" describe a one-way relationship, whereas the audit question is normally asked in both directions: given this figure, show the model; given this model, show the figures that depend on it.

15.4 Term 1.4 — Four-Oracle Median Aggregator

Element	Content
Operational definition	An aggregation procedure that ingests four independent price feeds and reports the median value, such that no single feed can move the reported value beyond the interval spanned by the remaining three.

Element	Content
Distinction	A mean average is moved by one extreme feed; the median is not. A quorum is a count; the median is an order statistic, and the two fail differently.
Evidentiary basis	To be supplied: operator identities and their independence; the aggregation code; a simulation showing single-feed insensitivity.
Justification	"Decentralised oracle" describes the sourcing of data and not the estimator; the estimator is the property that resists manipulation.

15.5 Term 1.5 — Book-Entry Securities Gap

Element	Content
Operational definition	The structural separation between the party holding legal title to a security at the record-holder level and the party holding the beneficial interest, with the consequence that actions taken at the record-holder level may not reach the beneficial holder.
Distinction	The gap is not a failure of the depository; it is a designed feature of nominee record-holding. The term names the consequence for notice, not a defect in settlement.
Evidentiary basis	The regulatory provisions and the framework's own analysis; any empirical incidence figure must be supported by a volume-and-line reference or struck.
Justification	"Book-entry system" names the mechanism; the framework's argument concerns the notice consequence, which needs its own term.

15.6 Term 1.6 — Vault A / Vault B Split and the Deep Cold Configuration

Element	Content
Operational definition	A two-pool segregation in which Vault A holds long-horizon, low-turnover assets under a custody configuration requiring multi-party authorisation and deliberate latency to move, and Vault B holds reserve assets available to the SLR Activation Engine within its deployment window.
Distinction	"Cold storage" describes a connectivity posture; the Deep Cold configuration describes an authorisation and latency posture, which is what constrains a wrongful transfer.

Element	Content
Evidentiary basis	To be supplied: the custody agreement; the authorisation matrix; the measured time to move from each vault.
Justification	Existing custody vocabulary conflates connectivity with authorisability; the framework's risk argument depends on the latter.

Part IV

Reconciliation, Citation, and Authority Registers

Chapter 16

Consolidated Schedule of Drafting Notes

The following table consolidates every drafting note raised in this instrument. A note is closed only when the instrument has been amended or the point has been recorded as a deliberate position.

Note	Subject	Required action	Status
D-1	Pillar codes against authority-domain codes	Adopt P1–P5 for pillars; retain CP/SG/DA/SR/LF for authority domains; publish the crosswalk.	Open
D-2	ML-DSA / ML-KEM parameter-set conflict	Choose one of three resolutions; publish a per-key parameter inventory.	Open
D-3	*Purdue Pharma* conflated with Article III	Plead release authority and adjudicatory authority separately; pin citations.	Open
D-4	"Ten jurisdictions" unsupported by the node table	Enumerate the remaining jurisdictions, or restate the claim.	Open
D-5	"3.5B" Vault A/B figure	Strike the figure, or identify the instrument and add a second model exhibit.	Open
D-6	Singapore regulator citation	Replace "Digital Asset Services Act (DASA)" with the Payment Services Act 2019 and related instruments; register the 2026 consultation as pending.	Open
D-7	Trust situs, asset situs and recognition	State law, trustee situs, custodian situs and resisting forum separately; reconcile with the PSDLEF trust.	Open
D-8	Release-tag pinning against the SHA-256 rule	Record tag, tag commit, build commit and manifest digest per component; confirm currency.	Open
D-9	Unsupported quantifications (40%; 1.15 million)	Trace to the Volume VIII methodology disclosure, or restate as design assumptions.	Open

Note	Subject	Required action	Status
D-10	Authority Identifier convention uninstantiated	Populate the identifier block at Chapter 18; apply forward.	Open

Chapter 17

Citation Schedule ([CITE REQUIRED] items)

Items below are authorities or figures relied upon in this instrument that require a verified reporter citation, or a volume-and-line reference, before the instrument is used in any filing. None should be presented as verified until the corresponding entry is completed.

Item	Proposition supported	Citation to be supplied
C-01	Publication notice is constitutionally insufficient where the holder is reasonably ascertainable	*Mullane v. Central Hanover Bank & Trust Co.*, 339 U.S. 306 (1950); *Mennonite Board of Missions v. Adams*, 462 U.S. 791 (1983). Verify pin cites.
C-02	Non-consensual third-party releases are not authorised by the Bankruptcy Code	*Harrington v. Purdue Pharma L.P.*, No. 23-124 (U.S. 27 June 2024). Pin to the official reporter; note the asbestos reservation and the 5–4 division.
C-03	Limits on adjudication of private rights by non-Article III tribunals	*Stern v. Marshall*, 564 U.S. 462 (2011). Verify the public-right / private-right framing as applied here.
C-04	Bankruptcy and trust courts are courts of equity	Authority as named in the source materials ("*Young v. United States*"). Pin cite to be verified; the proposition is conventionally supported by the equitable-maxims line of authority, which should be cited in the alternative.
C-05	Circuit split on textual rigidity of bar dates	Authority as named in the source materials ("*In re Alton*"). Reporter citation to be verified; if the case cannot be located, the proposition must be re-sourced or withdrawn.

Item	Proposition supported	Citation to be supplied
C-06	Transfer-agent search duty for lost securityholders	SEC Rule 17Ad-17, 17 C.F.R. § 240.17Ad-17. Record the 2026 proposal to extend outreach to inactive securityholders separately, and as pending.
C-07	40% unaccommodated error rate in beneficial-holder identification	Volume VIII methodology disclosure, page and line. If no such measurement exists, strike the figure and describe the phenomenon qualitatively.
C-08	1.15 million American participants	Volume VIII model exhibit, page and line, together with the definition of "participant" used in the count.
C-09	NIST post-quantum standards	FIPS 203 (ML-KEM), FIPS 204 (ML-DSA), FIPS 205 (SLH-DSA). Verify the final publication dates and the parameter sets actually deployed (D-2).
C-10	Largest-remainder or equivalent remedy for the record-holder gap	Any decision or statute on which the framework relies for the proposition that ascertainability can be satisfied through regulatory data.

Chapter 18

Authority Identifier Index (Reserved Block)

The block below assigns identifiers to the principal figures and specifications stated in this instrument, in the form `AUTH-<DOMAIN>-<VOLUME>-<NNN>`. Identifiers are reserved whether or not the underlying figure has yet been verified; a figure whose identifier appears here but whose supporting reference is blank is an open item under Chapters 16 and 17.

Identifier	Proposition or figure	Register
AUTH-DA-II-004	$500M principal partitioned $300M / $200M	Model
AUTH-DA-II-005	Modelled cash-flow basis for the partition	Model
AUTH-SR-II-006	DTC delivery path and book-entry treatment	Design target
AUTH-SR-III-002	FIPS 140-3 Level 4 hardware custody across three geo-vaults	Design target
AUTH-SR-III-011	Post-quantum signature and KEM parameter selection	Adopted standard / design
AUTH-SR-VI-003	SLR activation engine, four simultaneous trigger conditions	Proposal
AUTH-SR-VI-004	Four-step deployment sequence and reconciliation duty	Proposal
AUTH-DA-V-007	Three-tier governance model	Proposal
AUTH-DA-V-008	Quadratic voting cost function	Proposal
AUTH-LF-VIII-002	Swiss-situs purpose trust and governing-law election	Proposal
AUTH-SR-VII-008	32-node network across declared jurisdictions	Design target
AUTH-SR-VIII-021	Deep Cold custody configuration for Vault A	Design target
AUTH-SR-VIII-031	Proof of reserve, Merkle construction	Model
AUTH-SR-VIII-032	Proof of liability, Pedersen commitment	Model
AUTH-SR-VIII-040	API and schema exhibit (Volume VIII, Exhibit 11.2)	Reference
AUTH-DA-VIII-000	40% unaccommodated error rate	Unverified

Identifier	Proposition or figure	Register
AUTH-DA-VIII-001	1.15 million participant count	Unverified

Chapter 19

Reproducibility and Version-Control Register

Every computational artefact relied upon in the bound set is entered below. A row is complete only when all fields are populated; a row with a blank pin field is not reproducible and must not be described as reproducible.

Artefact	Release tag	Tag commit (SHA-256)	Dependency manifest digest	Verified by / date
Settlement node client	v28.0			
Lightning daemon	v0.18-beta			
Proof-of-reserve builder				
Proof-of-liability builder				
Oracle-median aggregator				
SLR deployment state machine				
Capital-partitioning model				

19.1 Statistical Analysis Plan Summary

The statistical analysis plan states, for each quantification relied upon in the bound set, the estimator, the data window, the treatment of missing data, and the sensitivity of the reported figure to each assumption. Where a figure is reported without a distributional property, it is reported as a point assumption and labelled as such.

19.2 Cryptographic Integrity Markers

Where a record is asserted to be cryptographically sealed, the record states the algorithm, the parameter set, the key identifier, and the verification procedure. Sealing a record with a parameter set that differs from the declared policy is a defect (see Drafting Note D-2), because the verification procedure will then not match the artefact.

Appendix A

Pre-Filing Audit Checklist

	Check
☐	Every figure carries an Authority Identifier and resolves to a model exhibit with a page-and-line reference.
☐	Every figure is labelled with its register, and modelled figures do not appear in the grammatical position of court findings.
☐	Every authority is pinned to an official reporter; no authority is cited only by name.
☐	Every coined term used in argument appears in the Definitional Exhibit with all four elements complete.
☐	Every software artefact has a tag, a tag commit, a build commit and a dependency manifest digest.
☐	The cryptographic parameter set declared in the policy matches the parameter set recorded for every key in the inventory.
☐	The pillar codes and authority-domain codes are used consistently throughout, with the crosswalk reproduced wherever both appear.
☐	All cross-volume references resolve to an existing exhibit in the bound set.
☐	Both jurisdictional compliance matrices state the correct instrument name, adopted or pending, for each jurisdiction.
☐	The arithmetic of every schedule sums to its stated total (node counts, partition amounts, vote costs).
☐	Each declaration of support is supported by a declaration of what the declarant examined.
☐	The instrument states the date on which each comparison to market practice was made.

Appendix B

Statement of Limitations

This instrument states a proposed architecture. It is not a legal opinion, and no part of it should be read as advice on the law of any jurisdiction. The figures designated **[MODEL / SIMULATION]** are outputs of the author's own models and are not measurements of any actual portfolio. The components designated **[PROPOSAL]** and **[DESIGN TARGET]** have not been adopted by, filed with, or approved by any court, regulator or fiduciary body. Authorities named in Chapter 17 are listed for verification, not for reliance; until each citation is completed, no argument in this instrument should be advanced as resting on that authority.

The Swiss purpose-trust structure described at Chapter 6 is a design proposal, and no statement in this instrument should be taken as a representation that any particular court would recognise, or decline to recognise, its effect on assets located outside the trust's chosen governing law.
